RegulareEdge

Regulatory Reporting & Compliance Management Platform

Resume content — ready-to-paste project descriptions

FULL VERSION (FOR A DEDICATED PROJECTS SECTION)

RegulareEdge — Regulatory Reporting & Compliance Management Platform

Java, Spring Boot 3.2, Spring Cloud, Spring Security (JWT), MySQL, OpenFeign, React 18, REST APIs

- **Built a microservices-based compliance platform** that digitizes how regulated firms prepare, certify, and submit regulatory returns to authorities, replacing manual email/Excel tracking with a single deadline-driven system.
- **Designed and developed the backend as 8 Spring Boot services** (API Gateway, Eureka discovery, Config Server, and 5 domain services) with role-based access control across 6 user roles enforced via JWT authentication and Spring Security @PreAuthorize.
- **Implemented the Data Owner module end-to-end:** secure PDF document upload/download (multipart, disk storage with UUID naming), a data-request lifecycle, and a certification workflow that auto-updates request status on sign-off.
- **Enabled inter-service communication using OpenFeign** with Resilience4j circuit breakers and retries for fault tolerance, and integrated a notification service so users are alerted when data is requested or actions are due.
- **Developed a role-based React (Vite) frontend** with route guards, an Axios API layer against the gateway, and reusable UI components, ensuring each role sees only its permitted screens.
- **Added cross-cutting concerns** — centralized configuration (Spring Cloud Config), service discovery (Eureka), request correlation-id tracing, and audit logging of every key action for compliance traceability.

COMPACT VERSION (2–3 LINES, IF SPACE IS TIGHT)

RegulareEdge – Compliance Management Platform *(Spring Boot Microservices, Spring Cloud, JWT, MySQL, React).*

Built a role-based regulatory-reporting platform using 8 Spring Boot microservices with JWT security, Eureka / Config Server / API Gateway, and OpenFeign + Resilience4j. Implemented the Data Owner module — PDF upload/download and a data-certification workflow — plus a role-based React frontend.

ONE-LINE VERSION (FOR A SUMMARY OR SKILLS MENTION)

Developed RegulareEdge, a Spring Boot microservices compliance-reporting platform (JWT-secured, Eureka / Config / Gateway, OpenFeign, MySQL) with a React frontend; owned the Data Owner module (PDF submission + certification workflow).

SKILLS & KEYWORDS (FOR YOUR SKILLS SECTION / ATS)

Java | Spring Boot | Spring Cloud | Microservices | REST APIs | Spring Security | JWT | OpenFeign | Resilience4j | Eureka Service Discovery | Spring Cloud Config | API Gateway | Spring Data JPA | Hibernate | MySQL | React | Axios | Role-Based Access Control | Maven | Git

USAGE TIPS

- **Keep ownership consistent** with how you describe it verbally — use “built” for what you led and “contributed to” for shared work.
- **Numbers strengthen bullets** — the figures used here (6 roles, 8 services) are accurate to the project; add team size or a demo link if available.
